

Ticket Fulfillment Analysis - Root Cause Report

Top 3 Root Causes of Tickets

1. Missing Data

- Most frequent issue observed.
- Suggests upstream systems or users are submitting incomplete forms or files.
- Often leads to downstream errors and delays in processing.

2. Format Error

- Highly recurring, especially in submissions involving structured files (e.g., EDI, JSON).
- Indicates a need for more robust input validation or clearer data formatting guidelines.

3. Connection Timeout

- A significant contributor to delays in ticket resolution.
- Suggests instability or slowness in data transmission systems or APIs used for submissions.

Suggested Improvements

1. Introduce Real-Time Field Validation at Entry Point

- Prevent submissions with missing required fields through validation at the source system.

2. Standardize and Enforce File Formats

- Provide updated, state-specific format templates and enforce automated rejection of invalid structures.

3. Improve Network Reliability and Retry Mechanisms

- Investigate and address connection timeout issues.
- Add retry logic and alerts for failed transmissions.
